# Environmental Taxation and Climate Policy: Legal, Economic, and Administrative Aspects

The volume is dedicated to environmental taxation as a crucial tool for addressing climate change. It begins with a conceptual overview discussing the rationale behind environmental taxes, focusing on energy taxes and carbon taxes.

Building on this foundation, the book explores legislative developments and international case studies including the EU's Energy Taxation Directive and examples from the OECD and developing countries. Further chapters compare carbon taxes with emissions trading systems and consider their application in developing countries. Finally, the book examines the role of environmental incentives in promoting green investment including case studies of the U.S. Inflation Reduction Act and EU state aid rules.
